

edp HALF TONNE PLASTIC BIN WASHER SOLUTION

The Mechatec Bin Washing Machines are well thought-out and versatile. The basis of this washing machine is the rotation frame of the BOXER bin rotating machine. The bin washing machines are available in single and double and fully automatic.

The machines are easy and simple to operate through a watertight touchscreen. The sight when placing a box in the machine is very good as the machine can be adjusted simply through a hole adjustment in height. The clamping frame clamps the bin and the interior and exterior of the bin will be cleaned thoroughly under pressure of 20-25 bar while the bin is rotating.

By setting more rotations the exterior of the bin will be cleaned more intensively.

By setting more rotations the exterior of the bin will be cleaned more intensively. When less water is available high pressure is used for cleaning. The usage of water will be 40-50 ltr/min at 60-50 bar. With a good high-pressure cleaner or heater (killing bacteria) you can reach an excellent result.

The system of these washing machines is a system that can be simply adjusted to the amount of water available. We have available options like a closed roof, front, or a dirty water recovery tray. The machine can be used as a disinfecting machine if required.
